INTRODUCTION

The WM9713 and WM9714 AC'97 audio CODECs are often used in portable audio applications requiring headphone output. They include a feature to automatically switch from stereo speaker output to headphone audio output when the headphone jack is inserted. This note describes how to ensure that jack detection is correctly recognised by the WM9713 and WM9714 devices when designing such an application.

AUDIO SWITCH PROPERTIES

A typical headphone circuit configuration is shown in figure 1. It is important to understand the properties of a standard 3.5mm headphone jack. When the jack is removed from the socket, the switch is closed (Pin 11 connected to pin 3) and the GPIO line is typically designed to be pulled low via a low resistance path to ground (R4 in this example). When the jack is inserted into the socket, the switch opens (Pin 11 not connected to pin 3) and the GPIO line is typically designed to be pulled high to the supply voltage rail via a large resistance (R2 in this example). R2 is a 1 MΩ resistor and limits the current drawn from the supply. This effect is summarised in table 1.

Figure 1  Typical Headphone Circuit Configuration
WM9713 AND WM9714 PROPERTIES

The presence of a headphone can be detected using one of four WM9713 / WM9714 GPIO pins. GPIO1/6/7/8 pins (pins 44, 3, 11 & 12) are available for this functionality. When the jack is inserted, the GPIO expects to see a low voltage (logic 0) when the switch on the socket opens. When the jack is removed the GPIO expects to see a high signal level (logic 1) as the switch on the socket closes. If the JIEN bit is set, the WM9713 and WM9714 will automatically switch between headphone and any other output configuration, typically ear speaker or stereo speaker. This configuration can be set up in the Powerdown and output PGA Mux select registers.

Table 2 shows the expected logic levels on the GPIO line of the WM9713 and WM9714 devices when the jack is inserted and removed.

INVERTING THE SIGNAL POLARITY

It can be clearly observed from tables 1 and 2 that there is a difference between the actual GPIO logic level and the expected GPIO logic level.

<table>

<td>Low (GND)</td>
<td>High (VDD)</td>
</tr>
</tbody>
</table>

Table 3 Comparison Between Expected and Actual Voltage on GPIO Line for Jack Insert Status

A signal inversion is needed to ensure that the GPIO line is at the correct logic level to enable jack detection to function properly. This signal inversion can be achieved using 2 extra components configured to operate as an inverting amplifier, as shown in figure 2. This circuit will invert the GPIO logic level from the jack switch circuit to ensure that it is at the correct level for jack detection at the GPIO pin (GPIO8 in this example) on the WM9713 or WM9714.

Figure 2 Inverting Amplifier
GPIO LOGIC LEVEL FROM 3.5MM SWITCH CIRCUIT | GPIO8 LOGIC LEVEL
---|---
High | Low
Low | High

Table 4 Input / Output Characteristics of Inverting Amplifier

The complete circuit from the headphone socket to the WM9713 / WM9714 device is shown in figure 3, with the WM9713 / 14 GPIO8 pin configured for jack insert detection. The HPL and HPR pins of the device are connected to the socket.

USING THE GPIO LINE ON THE HOST PROCESSOR

Another method for enabling Jack detection is to use a GPIO pin on the system processor. The circuit from Figure 1 can be used in this configuration. Connect the GPIO line to the processor GPIO pin. The processor can be programmed to write a series of instructions to the appropriate WM9713 / WM9714 registers to enable headphone output and disable speaker output when the jack is inserted and the GPIO line logic level goes high. This method requires that the processor has a free GPIO pin.

SUMMARY

Jack detection is a key feature in many applications. This technical note has illustrated how to design the necessary circuitry between the 3.5 mm headphone socket and the WM9713 / WM9714 device. Applications based on these devices should ensure that the correct logic level is presented to the GPIO pin from the headphone jack circuit by following the circuit design detailed in this application note. Alternatively, the system processor GPIO system can be used to detect jack insertion and adjust audio output configuration as desired.
APPLICATION SUPPORT

If you require more information or require technical support, please contact the Wolfson Microelectronics Applications group through the following channels:

Email: apps@wolfsonmicro.com
Telephone Apps: +44 (0) 131 272 7070
Fax: +44 (0) 131 272 7001
Mail: Applications Engineering at the address on the last page

or contact your local Wolfson representative.

IMPORTANT NOTICE

Wolfson Microelectronics plc ("Wolfson") products and services are sold subject to Wolfson’s terms and conditions of sale, delivery and payment supplied at the time of order acknowledgement.

Wolfson warrants performance of its products to the specifications in effect at the date of shipment. Wolfson reserves the right to make changes to its products and specifications or to discontinue any product or service without notice. Customers should therefore obtain the latest version of relevant information from Wolfson to verify that the information is current.

Testing and other quality control techniques are utilised to the extent Wolfson deems necessary to support its warranty. Specific testing of all parameters of each device is not necessarily performed unless required by law or regulation.

In order to minimise risks associated with customer applications, the customer must use adequate design and operating safeguards to minimise inherent or procedural hazards. Wolfson is not liable for applications assistance or customer product design. The customer is solely responsible for its selection and use of Wolfson products. Wolfson is not liable for such selection or use nor for use of any circuitry other than circuitry entirely embodied in a Wolfson product.

Wolfson’s products are not intended for use in life support systems, appliances, nuclear systems or systems where malfunction can reasonably be expected to result in personal injury, death or severe property or environmental damage. Any use of products by the customer for such purposes is at the customer’s own risk.

Wolfson does not grant any licence (express or implied) under any patent right, copyright, mask work right or other intellectual property right of Wolfson covering or relating to any combination, machine, or process in which its products or services might be or are used. Any provision or publication of any third party’s products or services does not constitute Wolfson’s approval, licence, warranty or endorsement thereof. Any third party trade marks contained in this document belong to the respective third party owner.

Reproduction of information from Wolfson datasheets is permissible only if reproduction is without alteration and is accompanied by all associated copyright, proprietary and other notices (including this notice) and conditions. Wolfson is not liable for any unauthorised alteration of such information or for any reliance placed thereon.

Any representations made, warranties given, and/or liabilities accepted by any person which differ from those contained in this datasheet or in Wolfson’s standard terms and conditions of sale, delivery and payment are made, given and/or accepted at that person’s own risk. Wolfson is not liable for any such representations, warranties or liabilities or for any reliance placed thereon by any person.
