Evaluation Board for CS43L22

Features

♦ Analog Passthrough Input
  - Four Stereo Line Input Jacks
  - Channel Mixer

♦ Analog Output
  - Stereo Headphone Jack w/ HP Detect Capability
  - Speaker Output via Differential Stereo PWM Terminals and Audio Jacks

♦ 8- to 96-kHz S/PDIF Interface
  - Optical and RCA S/PDIF Input Jacks
  - CS8416 Digital Audio Receiver

♦ I/O Stake Headers
  - External Control Port Accessibility
  - External DSP Serial Audio I/O Accessibility

♦ Multiple Power Supply options via Battery or External Power Supplies.

♦ 1.8 V to 3.3 V Logic Interface

♦ FlexGUI S/W Control - Windows® Compatible
  - Pre-Defined & User-Configurable Scripts

Description

Using the CDB43L22 evaluation board is an ideal way to evaluate the CS43L22. Use of the board requires an analog/digital signal source, an analyzer and power supplies. A Windows PC-compatible computer is also required in order to configure the CDB43L22.

System timing can be provided by the CS8416, by the CS43L22 with supplied master clock, or via an I/O stake header with a DSP connected. 1/8th inch audio jacks are provided for the analog passthrough inputs and HP/Line outputs. Two pairs of banana jacks and an additional pair of 1/8th inch audio jacks are provided to monitor the stereo differential speaker PWM output from the CS43L22. Digital input connections are via RCA phono or optical connectors to the CS8416 (S/PDIF Rx).

The Windows-based software GUI provided makes configuring the CDB43L22 easy. The software communicates through the PC’s USB port to configure the board and FPGA registers so that all features of the CS43L22 can be evaluated. The evaluation board may also be configured to accept external timing and data signals for operation in a user application during system development.

ORDERING INFORMATION

CDB43L22 Evaluation Board

1. SYSTEM OVERVIEW

The CDB43L22 platform provides analog and digital interfaces to the CS43L22 and allows for external DSP and I²C® interconnects. On-board power regulators are provided so that an external power supply upto +5 V can be used to provide power for the digital and analog cores of the CS43L22. On-board peripherals are powered from the USB connection which also serves as an interface to a PC. The CDB43L22 is configured using Cirrus Logic’s Windows-compatible FlexGUI software to read/write to device registers.

This section describes the various components on the CDB43L22 and how they are used. Section 2 on page 7 is a simplified quick connect guide provided for user convenience and can be used to set up the board quickly with the CS43L22 in its startup default configuration. Section 3 on page 8 describes the various configuration options in which the board can be used. Section 4 “Software Mode Control” on page 11 provides further configuration details and describes software functionality. The CDB43L22 schematic set is shown in Figures 7 through 18. Section 5 on page 17 provides a description of all stake headers and connectors, including the default factory settings for all jumpers.

1.1 Power

Power is supplied to the evaluation board via the USB connection or by applying +5.0 V to TP2. Jumper J34 allows the user to select the power source. Power (VP) and ground (GND) for the CS43L22 is supplied via binding posts J35 and J4 (respectively) or by standard AAA batteries in locations BT1, BT2 and BT3. The voltage provided to the binding posts can be in the range of +2.7 V to +5.25 V. On-board regulators and jumpers allow the user to connect the CS43L22’s supplies to +1.8 V, 2.5 V or +3.3 V for VL and +1.8 V or 2.5 V for VD, VA and VA_HP. All voltage inputs are referenced to ground using the black binding post J4.

Stake headers J47, J52, J53 and J74 provide a convenient way to measure supply currents to the CS43L22 for VA_HP, VL, VD and VA supplies respectively. The current can be easily calculated by measuring the voltage drop across the parallel resistors with its associated jumper removed.

NOTE: Stake headers J47, J48, J52, J53 and J74 must be shunted with the supplied jumpers during normal operation.

WARNING: Please refer to the CS43L22 data sheet for allowable voltage levels.

1.2 Grounding and Power Supply Decoupling

The CS43L22 requires careful attention to power supply and grounding arrangements to optimize performance. The CDB43L22 demonstrates these optimal arrangements. Figure 9 on page 19 provides an overview of the connections to the CS43L22. Figure 14 on page 24 shows the component placement, Figure 15 on page 25 shows the top layout, and Figure 18 on page 28 shows the bottom layout. Power supply decoupling capacitors are located as close as possible to the CS43L22. Extensive use of ground plane fill helps reduce radiated noise.

1.3 FPGA

The FPGA controls digital signal routing between the CS43L22, CS8416, SRC, PLL and the I/O stake header. It also provides routing control of the system master clock from an on-board oscillator and the CS8416. The Cirrus FlexGUI software provides full control of the FPGA’s routing and configuration options. Section 4 “Software Mode Control” on page 11 provides configuration details.

1.4 CS43L22

A complete description of the CS43L22 can be found in the CS43L22 product data sheet.
The CS43L22 is configured using the Cirrus FlexGUI. The device configuration registers are accessible via the “Register Maps” tab of the Cirrus FlexGUI software. This tab provides low-level control of each bit. For easier configuration, additional tabs provide high-level control. Section 4 “Software Mode Control” on page 11 provides configuration details.

1.5 CS8416 Digital Audio Receiver

A complete description of the CS8416 receiver and a discussion of the digital audio interface can be found in the CS8416 data sheet.

The CS8416 converts the input S/PDIF data stream from the optical or RCA connector into PCM data that is input to the CS43L22.

Selections are made by using the “Board Configuration” tab of the Cirrus FlexGUI software. Section 4 “Software Mode Control” on page 11 provides configuration details.

1.6 Oscillator

The socketed on-board oscillator can be selected as the system master clock source by using the selections on the “Board Configuration” tab of the Cirrus FlexGUI. Section 4 “Software Mode Control” on page 11 provides configuration details.

The oscillator is mounted in pin sockets, allowing easy removal or replacement. The device footprint on the board will accommodate full- or half-can-sized oscillators.

1.7 I/O Stake Headers

The evaluation board has been designed to allow interfacing with external systems via a serial port header (reference designation J8) and a control port header (reference designation J109). The serial port header provides access to the serial audio signals required to interface with a DSP (Figure 10 on page 20).

The control port header provides bidirectional access to the I²C control port signals by simply removing all the shunt jumpers from the “USB” position. The user may then connect a ribbon cable connector to the “Ext Sys Connect” pins for external control of board functions. A single row of “GND” pins are provided to maintain signal ground integrity. Two unpopulated pull-up resistors are also available should the user choose to use the CDB43L22 logic supply (VL) externally.

1.8 Analog Inputs

Four stereo jack connectors can be used to supply AC coupled line-level analog inputs to the CS43L22 for testing the device in passthrough mode.

Figure 10 on page 20 illustrates how the analog passthrough inputs are connected and routed. Table 5 on page 18 details the jumper selections. The CS43L22 data sheet specifies the allowed full scale input voltage level.

1.9 Analog Outputs

The CDB43L22 has a stereo headphone/line output jack (J40) and a dedicated stereo headphone (HP) output jack (J21) to monitor the CS43L22’s ground centered analog output. The dedicated HP jack (J21) has circuitry that drives the SPKR/HP pin low when a stereo jack is inserted thereby allowing users to test the CS43L22’s HP detect capability. Stake headers (J3 and J9) are provided to allow the user to select either a 16 Ω or a 32 Ω load for the headphone amplifier output. Stake headers (J1 and J2) are also provided to allow one to filter HP/Line outputs from the board. HP jack J21 can be used to connect a real headphone to provide an actual headphone load while performance measurements are taken on HP jack J40. When con-
nnecting headphones to either output jack, the on-board resistive load should be disconnected by removing
the jumpers on each stake header(J3 and J9).

The CDB43L22 also has A/B speaker output banana jacks (2 per A or B channel) and 1/8" jack outputs (1
per A or B channel). Stake headers J15 and J19 allow one to short the differential outputs of Channel A and
B together, in order to monitor MONO PWM output from the CS43L22. The red banana jacks designate the
positive speaker terminal connection and the black jacks designate the negative terminal connection.

1.10 Control Port Connectors

The graphical user interface for the CDB43L22 (Cirrus Logic Flex GUI) allows the user to configure the
CS43L22 registers and other component registers via the on-board I²C control bus. The GUI interfaces with
the CDB via the USB connection to a PC. Section 4 “Software Mode Control” on page 11 provides a de-
scription of the Graphical User Interface (GUI).

1.11 USB Connector

Connecting a USB port cable from a PC to the USB connector on the board and launching the Cirrus
FlexGUI software enables one to use the CDB43L22. Note: The USB port connection also provides DC
power to the board (except for VP). The minimum current required is approximately 300 mA. It may, there-
fore, be necessary to connect the CDB43L22 directly to the USB port on the PC as opposed to a hub or
keyboard port where current may be limited.
The following figure is a simplified quick start up guide made for user convenience. The following start up guide configures the board with a 1.8 V power supply to VL, VA, VA_HP and VD. The user may choose from steps 9 through 13 depending on the desired measurement. Refer to Section 3 on page 8 for details on how the various components on the board interface with each other in different board configuration modes. Refer to Section 4 on page 11 for descriptions on control settings in the Cirrus FlexGUI software.

2. Select the value of VA, VA, HP and VD as 1.8 V by shunting the top 2 pins of J25, J36 and J28 respectively.

3. Set VL to 1.8 V by shunting top 2 pins.

4. Shunt bottom 2 pins to receive board power from USB +5 V DC power.

5. Shunt left 2 pins of jumpers J16, J13, J20, J11, J17, J14, J23 and J12.

7. Shunt the left 2 pins on all rows of headers J8 and J109. Connect a ribbon cable to right 2 pins of all rows if external system connect is required.

8. Connect USB to board. Provide analog line level inputs via AIN1, AIN2, AIN3, AIN4 for testing the part in passthrough mode.

10. PCM digital audio input can also be provided to the board via header J78.

11. Provide analog line level inputs via AIN1, AIN2, AIN3, AIN4 for testing the part in passthrough mode.

13. Connect power source of 4.5 V between VP and GND or connect 3 1.5 V AAA batteries on back of board with correct polarities. Specify the power source by shunting appropriate pins on J5.

*Refer to section 3 for quick setup descriptions.
3. CONFIGURATION OPTIONS

In order to configure the CDB43L22 for making performance measurements, one needs to use Cirrus Logic’s Windows compatible FlexGUI software to program the various components on the board. This section serves to give a deeper understanding of the on-board circuitry and the digital clock and data signal routing involved in the different configuration modes of the CDB43L22. The section also has the expected performance characteristics which are observed when using the board in the respective configuration mode.

3.1 SPDIF In to Headphone or Line Out

The CS43L22’s stereo headphone/line output performance can be tested by loading the “SPDIF In to Headphone or Line Out” quick setup file provided with the software package. The script configures the digital clock and data signal routing on the board as shown in Figure 1.

Stereo audio outputs can be monitored on the 1/8” jacks J21 or J40. HP jack J21 can be used to connect a real headphone to provide an actual headphone load while performance measurements are taken on HP jack J40. Digital S/PDIF input can be provided on the optical (OPT2) or RCA (J68) jacks. Jumpers J8 and J9 can be used to select output loads and jumpers J1 and J2 can be used to select filtered or unfiltered outputs. Refer to Section 4 on page 11 for details on software configuration.

![Figure 1. SPDIF In to Headphone or Line Out](image)

Table 1 shows the expected performance characteristics one should expect when using the CDB43L22 for SPDIF In to Headphone or Line Out measurements.

3.2 SPDIF In to Stereo Speaker Out

The CS43L22’s stereo differential PWM speaker output performance can be tested by loading the “SPDIF In to Stereo Speaker Out” quick setup file provided with the software package. The script configures the digital clock and data signal routing on the board as shown in Figure 2.

Stereo output jacks J6 and J18 can be used to monitor filtered PWM output for measurement purposes. The figure shows how a real speaker or a speaker model should attach to the binding posts during performance tests. Digital S/PDIF input can be provided on the optical (OPT2) or RCA (J68) jacks. Refer to Section 4 on page 11 for details on software configuration.

Table 2 shows the expected performance characteristics one should expect when using the CDB43L22 for SPDIF In to Stereo Speaker Out measurements.

3.3 **SPDIF In to Mono Speaker Out**

The CS43L22’s mono differential PWM speaker output performance can be tested by loading the “**SPDIF In to Mono Speaker Out**” quick setup file provided with the software package. The script configures the digital clock and data signal routing on the board as shown in Figure 2.

Stereo output jacks J6 and J18 can be used to monitor filtered PWM output for measurement purposes. The figure shows how a real speaker or a speaker model should attach to the binding posts during performance tests. Please note how ONLY the tip from the stereo jacks is used to attach the mono differential channel to the measurement device. Digital S/PDIF input can be provided on the optical (OPT2) or RCA (J68) jacks. Refer to **Section 4 on page 11** for details on software configuration.

4. SOFTWARE MODE CONTROL

The CDB43L22 may be used with the Microsoft Windows®-based FlexGUI graphical user interface, allowing software control of the CS43L22, FPGA and CS8416 registers. The latest control software may be downloaded from www.cirrus.com/msasoftware. Step-by-step instructions for setting up the FlexGUI are provided as follows:

1. Download and install the FlexGUI software as instructed on the Website.
2. Connect and apply power to the +5.0 VP binding post.
3. Connect the CDB to the host PC using a USB cable.
4. Launch the Cirrus FlexGUI. Once the GUI is launched successfully, all registers are set to their default reset state.
5. Refresh the GUI by clicking on the “Update” button. The default state of all registers are now visible.

For standard set-up:
6. Set up the signal routing in the “Board Configuration” tab as desired.
7. Set up the CS43L22 in the “Passthrough, Power and Serial Audio Interface Configuration”, “DSP Engine” and “Analog and PWM Output Volume” tab as desired.
8. Begin evaluating the CS43L22.

For quick set-up, the CDB43L22 may, alternatively, be configured by loading a predefined sample script file:

9. On the File menu, click "Restore Board Registers..."
10. Browse to Boards\CDB43L22\Scripts\.
11. Choose any one of the provided scripts to begin evaluation.

To create personal scripts files:

12. On the File menu, click "Save Board Registers..."
13. Enter any name that sufficiently describes the created setup.
14. Choose the desired location and save the script.
15. To load this script, follow the instructions from step 9 above.
4.1 Board Configuration Tab

The “Board Configuration” tab provides high-level control of signal routing on the CDB43L22. This tab also includes basic controls that allow “quick setup” in a number of simple board configurations. Status text detailing the CS43L22’s specific configuration appears directly below the associated control. This text may change depending on the setting of the associated control. A description of each control group is outlined below:

**CS43L22 Basic Configuration** - Includes controls for configuring the interface format, clocking functions and analog input signal routing in the CS43L22. See Section 4.2 through Section 4.4 for more controls in the CS43L22.

**CS8416 S/PDIF Receiver Control** - Register controls for setting up the CS8416.

**Clock Source and Routing Selection** - Includes controls used to configure the value and source of the master, frame and bit clocks which are sent to the CS43L22.

**Update** - Reads all registers in the FPGA, CS43L22 and the CS8416 and shows the current values in the GUI.

**Reset** - Resets FPGA to default routing configuration.

![Figure 4. Board Configuration Tab](image)
4.2 Passthrough, Power and Serial Audio Interface Configuration Tab

The "Passthrough, Power and Serial Audio Interface Configuration" Tab provides high-level control of the CS43L22 passthrough, power control and serial port register settings. Status text detailing the CS43L22’s specific configuration is shown in parenthesis or appears directly below the associated control. This text will change depending on the setting of the associated control. A description of each group is outlined below. See the CS43L22 data sheet for complete register descriptions.

**Power Control** - Register controls for powering down each section within the CS43L22.

**Analog Passthrough Configuration** - Controls for the input mixer (summing amp) and analog passthrough settings.

**Serial Port Configuration** - Controls for all settings related to the serial I/O data and clocks on the board.

**Update** - Reads all registers in the CS43L22 and reflects the current values in the GUI.

**Reset** - Resets the CS43L22.

![Figure 5. Passthrough, Power and Serial Audio Interface Configuration Tab](image-url)
4.3 DSP Engine Tab

The "DSP Engine" tab provides high-level control of the SDIN (PCM) data volume level, the PCM mix volume level and the overall DAC/PWM channel volume level. DAC/PWM channel Limiter, Tone Control and Beep Generator control functions are also provided. Status text detailing the CS43L22’s specific configuration is shown in parenthesis or inside the control group of the affected control. This text will change depending on the setting of the associated control. A description of each control group is outlined below. See the CS43L22 datasheet for complete register descriptions.

**Digital Volume Control** - Digital volume controls and adjustments for the SDIN data and overall channel volume. Mute, gang, invert and de-emphasis functions are also available.

**Limiter** - Configuration settings for the Limiter.

**Tone Control** - Bass and treble volume controls and filter corner frequencies.

**Beep Generator** - On/Off time, frequency, volume, mix and repeat beep functions.

**Update** - Reads all registers in the CS43L22 and reflects the current values in the GUI.

**Reset** - Resets the CS43L22.

![Figure 6. DSP Engine Tab](image-url)
The “Analog and PWM Output Volume” tab provides high-level control of the CS43L22 PWM outputs, HP/Line output volume levels and charge pump frequency. This tab also provides controls for the PWM output including speaker volume and PWM gain. Temperature and Battery monitoring controls for the PWM/Speaker outputs are also on this tab. Status text detailing the CS43L22’s specific configuration is shown in read-only edit boxes, in parenthesis or appears directly below the associated control. This text will change depending on the setting of the associated control. A description of each control group is outlined below. See the CS43L22 datasheet for complete register descriptions.

**Headphone/Line Analog Output** - Volume controls and adjustments for the DAC channel (outside of the DSP). The modulation index and gain settings make up the parameters that determine the full scale headphone/line output level.

**PWM Output** - Volume, mute, power down and other functional controls for the PWM speaker outputs.

**Temperature and Battery Monitor/Control** - Battery Compensation, Thermal Foldback, Temperature Shutdown and Battery Monitor for the PWM/Speaker outputs.

---

![Figure 7. Analog and PWM Output Volume Tab](image)

**Figure 7. Analog and PWM Output Volume Tab**
4.5 Register Maps Tab

The Register Maps tabs provide low-level control of the CS43L22, CS8416, CS8421, FPGA and GPIO register settings. Register values can be modified bit-wise or byte-wise. “Left-clicking” on a particular register accesses that register and shows its contents at the bottom. The user can change the register contents by using the push-buttons, by selecting a particular bit and typing in the new bit value or by selecting the register in the map and typing in a new hex value.
